Contribution Journal

For my contribution to this week's assignment, I worked through each step of the Module 6 lab regarding regression/classification. I inputted my code within the cells as needed, answered the reflection questions at the end of the notebook, and recorded my experience on both journal pages. I volunteered to turn in this week's assignment on behalf of the group. This meant I compiled all of the notebooks, journals, contributions for each member. I made sure to stay in communication with every member to ensure everyone's work is included and ask questions when needed. Afterwards, I uploaded all the necessary files into a repository in GitHub for grading.

Lab 06 – Contribution

My contribution was preparing the data, running the models, evaluating their results, and completing the knowledge check.

Lab 06 Contribution Journal: Regression and Classification

In this lab I completed both coding tasks, printed the model coefficients, and wrote my answers to the three knowledge check questions. This lab had two tasks: Task 1 uses Linear Regression to predict Fare from Age and Pclass, and Task 2 used Logistic Regression to predict Survived from Age, Pclass and Sex. Before starting I fixed the notebook file, because when I opened it in Colab I noticed that it in every line in each cell joined into one long line, with no formatting. In Task 1, I also changed the line, so it prints the real value of 58 dollars; the template had the print line set to 48 dollars. After completing the notebook, I wrote my reflection and contribution journal, saved them as doc files for easier appending, then sent my completed notebook and both journals to group member Aaliyah for submission.

Lab 06 – Contribution Journal Diane Lenhoff

ITAI 1371 – Machine Learning

Work Completed:

For Lab 06, I worked on building and evaluating a Linear Regression model using the Titanic dataset. I prepared the data, used passenger age and class as features, and trained the model to predict ticket fares. I also tested the model and calculated the Mean Squared Error (MSE) and Root Mean Squared Error (RMSE).

My Contributions:

I completed the Linear Regression coding exercise, evaluated the results, and examined the model coefficients. My model produced an MSE of 3,364.92 and an RMSE of $58.01. I also interpreted the coefficients to understand how passenger age and class influenced predicted fares.

Challenges and Lessons Learned:

One thing I found interesting was that passenger class had a much larger effect on predicted fares than age. I also learned that getting a model to run successfully does not necessarily mean its predictions are accurate. Understanding the error measurements is just as important as building the model.

Reflection:

This lab helped me become more comfortable with training a machine learning model and interpreting its results. I would like to experiment with additional features to see whether I can improve the predictions. Overall, I gained a better understanding of how Linear Regression works and how it can be applied to real data.

KeiChara Fleeks-Jones

My contribution to this lab was running the notebook and completing each task as needed and verified the output. I answered the questions at the end in the markdown cell to the best of my ability from what I understand and my observations. I then discussed and compared the results with my fellow teammates.
